Programming Languages, Part A - University of Washington (4.9 ⭐)

Difficulty: Intermediate

Skills: inference ml (programming language) higher-order function functional programming type inference pattern matching euler's totient function language ?-recursive function Computer Programming computer-science software-development

Description: This course is an introduction to the basic concepts of programming languages, with a strong emphasis on functional programming. The course uses the languages ML, Racket, and Ruby as vehicles for teaching the concepts, but the real intent is to teach enough about how any language ⍰fits together⍰ to make you more effective programming in any language — and in learning new ones. This course is neither particularly theoretical nor just about programming specifics — it will give you a framework for understanding how to use language constructs effectively and how to design correct and elegant programs. By using different languages, you will learn to think more deeply than in terms of the particular syntax of one language. The emphasis on functional programming is essential for learning how to write robust, reusable, composable, and elegant programs. Indeed, many of the most important ideas in modern languages have their roots in functional programming. Get ready to learn a fresh and beautiful way to look at software and how to have fun building it. The course assumes some prior experience with programming, as described in more detail in the first module. The course is divided into three Coursera courses: Part A, Part B, and Part C. As explained in more detail in the first module of Part A, the overall course is a substantial amount of challenging material, so the three-part format provides two intermediate milestones and opportunities for a pause before continuing. The three parts are designed to be completed in order and set up to motivate you to continue through to the end of Part C. The three parts are not quite equal in length: Part A is almost as substantial as Part B and Part C combined. Week 1 of Part A has a more detailed list of topics for all three parts of the course, but it is expected that most course participants will not (yet!) know what all these topics mean.

Building AI Applications with Watson APIs - IBM (3.8 ⭐)

Difficulty: Beginner

Skills: weak ai e-nable Python Programming application programming interfaces Cloud Computing extract Computer Programming Average Machine Learning enabling data-science machine-learning

Description: A learner will be able to write an application that leverages multiple Watson AI services (Discovery, Speech to Text, Assistant, and Text to Speech). By the end of the course, they⸮ll learn best practices of combining Watson services, and how they can build interactive information retrieval systems with Discovery + Assistant.

Building AI Powered Chatbots Without Programming - IBM (4.7 ⭐)

Difficulty: Beginner

Skills: weak ai Machine Learning environment variable wordpress Computer Programming word (computer architecture) Python Programming tree (data structure) child preview computer-science design-and-product

Description: This course will teach you how to create useful chatbots without the need to write any code. Leveraging IBM Watson's Natural Language Processing capabilities, you'll learn how to plan, implement, test, and deploy chatbots that delight your users, rather than frustrate them. True to our promise of not requiring any code, you'll learn how to visually create chatbots with Watson Assistant (formerly Watson Conversation) and how to deploy them on your own website through a handy WordPress plugin. Don't have a website? No worries, one will be provided to you. Chatbots are a hot topic in our industry and are about to go big. New jobs requiring this specific skill are being added every day, consultants demand premium rates, and the interest in chatbots is quickly exploding. Gartner predicts that by 2020, 85% of customer interactions with the enterprise will be through automated means (that's chatbots and related technologies). Here is your chance to learn this highly in demand set of skills with a gentle introduction to the topic that leaves no stone unturned.
